Specialist, dermatological opinion regarding an
EXPERIMENTAL DERMATOLOGICAL EXAMINATION
OF THE EFFICACY IN A BLEACHING TEST
ON NATURAL TEETH

Designation of the preparation:

“Uli Breiter ZAHNWEISS-PULVER”

Customer: **BREITER-Gruppe**
P.O. Box 100150
D-85001 Ingolstadt

Test persons: 25 probands, all with healthy oral mucosa

Test period: 2 weeks

Frequency of use: twice daily, after brushing their teeth in each case

2.0 Summary evaluation

Bleaching of the teeth is evident by an increase in brightness value, measured by an L-value increase.

After 14 days of application, compared with the initial value of all probands, an average L-value increase of 2.02 was determined, and bleaching was thus established.

With those probands (12 persons) whose brightness value L was below the average of all probands (25) of 67.05 before the start of the test, there was an increase in brightness value L by 4.31 at the end of the test.

**In summary, and from a dermatological point of view,
it can be stated that the product “Uli Breiter ZAHNWEISS-PULVER”
had a bleaching effect of approx. 2.02 (over 3%)
over a test period of 2 weeks and with twice daily application
in a group of 25 probands compared with the initial status.**
